

UxV/35 Interop Set Usage

The UxV/35 bus has a defined set of signals for usage on various Uncrewed Vehicles in different domains – Land, Surface and Air.

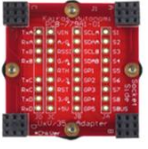

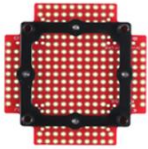

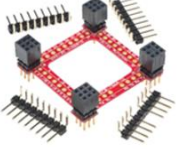

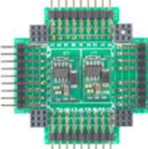

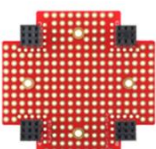

These signals are common among other 3rd party flight stacks and components as well. In most cases it is a matter of connecting wires between the UxV/35 stack or component and the 3rd part component signals.

These boards ease that integration with a suite of interoperability boards that address common needs such as identified signals, physical mounting, etc.

UxV/35 System Interoperability among 3rd party boards and modules is made efficient and reproducible using the KA1050-01 UxV/35 Interoperability Board Set.

UxV/35

The Prototype 30.5mm board has UxV/35 male pins on one side and the 30.5mm square mounting holes found common on other UAV flight stack systems.

All UxV/35 pins are brought to the interface area to ease the creation of custom circuitry adapting to 3rd party flight components.

This Interop board has female UxV/35 pins on one side and the 30.5mm square mounting standard on the other. All UxV/35 pins are brought out for connection to 3rd party flight stack components.

There are versions of this board with JST-GH series connectors and other fine pitch connectors commonly found on 3rd party flight components.
